

ABSTRACT

1
2
3 An anti-piracy system introduces distortion into a recorded image, while
4 maintaining a high quality projected image. The video source material includes
5 modulated entities for providing artifacts incompatible with the content of the video
6 source material and selectively deliverable information that the projection system uses to
7 demodulate the entities. A projector receives the information about the modulated entity
8 and corrects, or demodulates, the entity. The projection system also imposes a recording
9 device dependent interference on the projected images.
